We have received review comments back from the State of Colorado on the "Close-out Radiological Survey Report for Building 779 Administration Building" (see below), our review also found no areas above release limits and we concur that the building is ready for demolition. It should be noted that our review also included the "Non-radiological Close-out Report" that indicated the facility does not contain any hazardous waste above regulatory limits. You are authorized to proceed.

Subject: 779 Annex A final surveys

The state has received and reviewed the "Closeout Radiological Survey Report for Building 779 "A" Annex " and the Non-Radiological Closeout Report for the A-Annex. Our evaluation of the reports concludes that the surveys were appropriately performed and the resultant data fully supports the categorization of the building segment as free-releasable per the criteria set-forth within the Decommissioning Operations Plan.

The report was reviewed by state staff as well as staff from EPA. State/EPA staff met with building 779 staff to review details of the survey implementation, including review of raw-data and quality assurance records.

We have received word from Mr. Steve Rima of the DOE independent verification team describing their review of the plan and independent measurements, including their conclusions that the building segment is suitable for demolition as non-radiological material.

Based on these intensive reviews, verification efforts and quality assurance data, the state has significant confidence that the remaining Annex-A building structure meets the free-release requirements of the DOP and notes that these standards are consistent with those used in the commercial sector, outside the RFETS fenceline. We concur with the KH conclusion that the building segment is suitable for demolition as described within the approved demolition plan.

Feel free to call me at (303) 966-2115 if any clarification is needed.
